## SPECIFICATION

### UREA COMPOUNDS, THEIR PRODUCTION AND USE

#### TECHNICAL FIELD

The present invention relates to urea compounds which are  
5 useful for the treatment of acquired immunodeficiency syndrome  
(AIDS), their production and use.

#### BACKGROUND ART

HIV (human immunodeficiency virus) protease inhibitors  
have been developed for the treatment of AIDS and use of the  
10 protease inhibitors in combination with two conventional HIV  
reverse transcriptase inhibitors has provided further progress  
in the treatment of AIDS. However, these drugs and their  
combination use are not sufficient to eradicate AIDS, and new  
anti-AIDS drugs based on different activities and mechanisms  
15 are therefore required.

CD4 is a known receptor from which HIV invades a target  
cell. Recently, CCR5 has been discovered as a second receptor  
of macrophage-tropic HIV. CCR5 is a G-protein-coupled  
chemokine receptor having seven transmembrane domains. This  
20 chemokine receptor is thought to play an essential role in  
establishment and spread of HIV infection. In fact, it is  
reported that a person who is resistant to HIV infection in  
spite of several exposures retains mutation of homo deletion of  
CCR5 gene. Therefore, a CCR5 antagonist is expected to be a  
25 new anti-HIV drug.

As chemokine receptor antagonists, there are known  
aromatic urea derivatives (J. Biol. Chem., 1998, 273, 10095-  
10098), benzodiazepine derivatives (Japanese unexamined patent  
publication No.9-249570), cyclam derivatives (Nat. Med., 1998,  
30 4, 72-77), spiro piperidine derivatives (WO98/25604, 25605),  
acridine derivatives (WO98/30218), xanthene derivatives  
(WO98/04554), haloperidol derivatives (J. Biol. Chem., 1998,  
273, 15687-15692., WO98/24325, 02151), benzazocine-type

compound (Japanese unexamined patent publication No.9-25572), benzimidazole derivatives (WO98/06703), piperazine and diazepine derivatives (WO97/44329), 3-di-substituted piperidine derivatives (Japanese unexamined patent publication No. 9-249566), 4-substituted piperidine derivatives (WO99/04794), substituted pyrrolidine derivatives (WO99/09984, WO99/38514), etc. However, so far, there has been no report that a CCR5 antagonist is developed as a therapeutic agent of AIDS.

#### DISCLOSURE OF THE INVENTION

10 In order to investigate an anti-AIDS drug having CCR5 antagonistic activity, it is necessary to clone CCR5 gene from human tissue derived cDNA library, to ligate said gene with a vector for expression in animal cells, to introduce said gene into animal cells and to obtain cells expressing  
15 CCR5. In addition, with using this transformant, it is necessary to screen a compound which strongly inhibits binding of CC chemokine RANTES, which is natural ligand, to CCR5. However, so far there has been no report on a low molecule compound having CCR5 antagonistic activity.

20 The present inventors diligently made extensive studies on compounds having CCR5 antagonistic activity and, as a result, they found that a compound represented by the formula (I) or a salt thereof exhibits superior CCR5 antagonistic activity and is useful for inhibition of HIV infection to human peripheral  
25 blood mononuclear cells (especially medicament for treatment or prevention of AIDS), and also that the compound has superior absorbability when orally administered. Based on the finding, the present invention was accomplished.

20 The Compound (I) of the present invention has potent CCR antagonistic activity (in particular, potent CCR5 antagonistic activity) and therefore can be used for the treatment or prevention of various infectious diseases of HIV in human, for example, AIDS. The compound (I) of the present invention is 25 low toxic and safely used.

mixing individually or simultaneously with pharmaceutically acceptable carriers, excipients, binders, diluents or the like, which can be administered orally or non-orally as a pharmaceutical composition. It is well absorbed by orally. It  
5 can be administrated as tablets, capsules, granules and powders.

The dose per day of the compound (I) varies depending on the condition and body weight of a patient, administration route, etc. Typical daily dose per adult patient (body weight: 50 Kg) for oral administration is about 5 to 1000 mg,  
10 preferably about 10 to 600 mg, more preferably about 10 to 300 mg, and in particular about 15 to 150 mg, as an active ingredient [the compound (I)] and the compound (I) is administered once or 2 to 3 times per day.

The compound (I) of the present invention may be used in  
15 combination with other drugs for the treatment or prevention of infectious disease of HIV (in particular, a drug for the treatment or prevention of AIDS). In this case, these drugs can be formulated by mixing individually or simultaneously with pharmaceutically acceptable carriers, excipients, binders,  
20 diluents or the like, which can be administered orally or non-orally as a pharmaceutical composition for the treatment or prevention of infectious disease of HIV. In the case of formulating these effective components individually, while the individually formulated agents can be administered in the form  
25 of their mixture prepared by using e.g. a diluent when administered, the individually formulated agents can also be administered separately or simultaneously or with time intervals to the one and same subject. A kit for administering the individually formulated effective components in the form of  
30 their mixture prepared by using e.g. a diluent when administered (e.g. a kit for injection which comprises two or more ampoules each comprising a powdery component and a diluent for mixing and dissolving two or more components when

administered, etc.), a kit for administering the individually formulated agents simultaneously or with time intervals to the one and the same subject (e.g. a kit for tablets to be administered simultaneously or with time intervals,

5 characterized by having two or more tablets each comprising an agent and said tablets being put in one or separate bags and, if necessary, a column to describe time to be administered each agent, etc.), etc. are also included by the pharmaceutical composition of the present invention.

30 second receptor of T cell-tropic HIV-1) such as AMD-3100, etc., an antibody against HIV-1 surface antigen, HIV-1 vaccine, etc., in addition to the above-mentioned protease inhibitor, reverse transcriptase inhibitor, etc.

When the compound (I) is used in combination with a reverse transcriptase inhibitor and/or a protease inhibitor, the dose of the reverse transcriptase inhibitor or the protease inhibitor ranges, for example, from about 1/200 to 1/2 or more of usual dose to about 2 to 3 times or less of usual dose. In case that two or more drugs are used in combination, each dose of the drugs is appropriately adjusted if one drug affects metabolism of the other drug, while each dose of the drugs when they are used in combination is generally the same as the dose when they are used alone.

Typical daily dose of the reverse transcriptase inhibitor and the protease inhibitor is as follows:

#### Test Example

20 (1) Cloning of human CCR5 chemokine receptor

Cloning of CCR5 gene was carried out by PCR (polymerase chain reaction) from human spleen cDNA. With using 0.5 ng of spleen cDNA (Toyobo, QUICK-Clone cDNA) as a template, PCR was performed in DNA Thermal Cycler 480 (Perkin-Elmer) (reaction conditions: 30 cycles of 95°C for 1 minute, 60°C for 1 minute, and 75°C for 5 minutes) by adding primer set,  
 5'- CAGGATCCGATGGATTATCAAGTGTCAAGTCCAA -3' (25 pmol) and  
 5'- TCTAGATCACAAGCCACAGATATTTCTGCTCC -3' (25 pmol),  
 which were designed referring to nucleotide sequence of CCR5  
 30 gene reported by Samson et al. (Biochemistry, 35(11), 3362-3367 (1996)) and by using TaKaRa EX Taq (Takara Shuzo). The resultant PCR product was subjected to agarose gel electrophoresis to collect about 1.0kb DNA fragment, which was

subjected to Original TA Cloning Kit (Funakoshi) to carry out cloning of CCR5 gene.

(2) Preparation of plasmid for expression of human CCR5

The plasmid obtained in the above (1) was digested with  
5 restriction enzymes XbaI (Takara Shuzo) and BamHI (Takara Shuzo) and subjected to agarose gel electrophoresis to collect about 1.0kb DNA fragment. The DNA fragment was mixed with plasmid pcDNA3.1 (Funakoshi) for expression in animal cells, said plasmid being digested with XbaI and BamHI, and they were  
10 ligated with DNA Ligation Kit Ver.2 (Takara Shuzo). The resulting plasmid was subjected to transformation of competent cell of E. coli JM109 (Takara Shuzo) to give plasmid pCKR5.

(3) Introduction of plasmid for expression of human CCR5 into CHO-K1 cell and Expression of the plasmid in CHO-K1 cell

15 CHO-K1 cells were grown in 750 ml of tissue culture flask (Becton Dickinson) using Ham's F12 medium (Nihon Pharmaceutical) containing 10% fetal calf serum (Life Tech Oriental) and took off with 0.5 g/L trypsin-0.2 g/L EDTA (Life Tech Oriental). The cells were washed with PBS (Life Tech  
20 Oriental), centrifuged (1000 rpm, 5 minutes), and suspended in PBS. With using Gene Pulser (Bio-Rad Laboratories), DNA was introduced into the cells under the conditions shown below. That is, to the cuvette having 0.4 cm gap were added  $8 \times 10^6$  cells and 10  $\mu$ g of plasmid pCKR5 for expression of human CCR5,  
25 and electroporation was carried out under 0.25 kV of voltage and 960  $\mu$ F of capacitance. The cells were transferred into Ham's F12 medium containing 10% fetal calf serum, and cultivated for 24 hours. The cells were again took off and centrifuged, and suspended in Ham's F12 medium containing 10%  
30 fetal calf serum and 500  $\mu$ g/ml of geneticin (Life Tech Oriental). The suspension was diluted to give  $10^4$  cells/ml of the suspension, which was inoculated on 96 well plate (Becton Dickinson) to give geneticin resistant cells.

Then, the resulting geneticin resistant cells were cultivated in 96 well plate (Becton Dickinson), and cells expressing CCR5 were selected from the geneticin resistant cells. That is, in an assay buffer (Ham's F12 medium  
5 containing 0.5% BSA and 20 mM HEPES (Wako Pure Chemical, pH 7.2) to which was added 200 pM of [<sup>125</sup>I]-RANTES (Amersham) as a ligand, binding reaction was carried out at room temperature for 40 minutes, and the buffer was washed with ice-cooled PBS. To the buffer was added 50 µl/well of 1M NaOH, and the mixture  
10 was stirred. Radioactivity was determined with γ-counter to select CHO/CCR5 cells which specifically bound with the ligand.

(4) Evaluation of Test Compounds based on CCR5 antagonistic activity

The CHO/CCR5 were inoculated on 96 well microplate (5x10<sup>4</sup>  
15 cells/well) and cultivated for 24 hours. The medium was removed by means of suction, and to each well was added assay buffer containing Test Compound (1 µl) and then 100 pM of [<sup>125</sup>I]-RANTES (Amersham) as a ligand. The reaction was carried out at room temperature for 40 minutes, and assay buffer was  
20 removed by means of suction. Each well was washed twice with cooled PBS, and 200 µl of Microscinti-20 (Packard Instrument, Inc.) was added to each well. Radioactivity was determined with Top-Count Micro Scintillation Counter (Packard Instrument, Inc.).

25 According to the method described above, the inhibition rate of the test compounds for CCR5 binding was determined.

The results are shown in Table 1.

Example Number	Inhibition Rate (%) at 1.0 $\mu$ M
1	96
7	92
10	100
12	92
13	67

(5) Inhibitory effect on HIV-1 infection to MAGI-CCR5 cell

The plasmid where  $\beta$ -galactosidase gene was ligated to the downstream of HIV-1 LTR was introduced into CD4 positive HeLa cell, to which human CCR5 was further introduced to obtain transformant MAGI-CCR5. By using said transformant MAGI-CCR5, the degree of HIV-1 infection was calculated from  $\beta$ -galactosidase activity (blue color due to decomposition of 5-bromo-4-chloro-3-indolyl- $\beta$ -D-galactopyranoside). Specifically, MAGI-CCR5 cells were suspended in DMEM medium containing 10% serum to prepare  $5 \times 10^4$  cells/ml suspension. To each well of 96 well plate was inoculated 200  $\mu$ l of the suspension, and the cells were cultivated at 37°C overnight. The medium was removed by means of suction, and to the residue was added 100  $\mu$ l of the above medium containing 0.32  $\mu$ M of Test Compound and 100  $\mu$ l of the above medium containing 300PFU of HIV-1 Ba-L cells. The final concentration of the test compound was 0.16  $\mu$ M. The cells were cultivated at 37°C for 2 days. The medium was removed by means of suction. To the residue was added 200  $\mu$ l of cell fixative (PBS containing 1% formaldehyde and 0.2% glutaraldehyde), and the mixture was allowed to stand at room temperature for 5 minutes and washed twice with PBS. To the mixture was added 100  $\mu$ l of staining solution (PBS containing 4  $\mu$ M potassium ferrocyanide, 4  $\mu$ M potassium ferricyanide, 2  $\mu$ M  $MgCl_2$ , and 0.4 mg/ml X-gal), and the mixture was allowed to stand at 37°C for 50 minutes and washed twice with PBS. The

number of blue cells was counted by microscope and defined as the number of cells infected with HIV-1. According to this method, inhibition rate on HIV-1 infection was determined and found that Compounds obtained from Example 76 shows 98%

5 inhibition on HIV-1 infection.
